Like Engage · v2.1.0

A simple, step-by-step guide

> Open a queue of post links and like each exact post. No Generate, Comment, Repost or AI charge in this mode.

Before you press Start

1. Sign in to Fix with your Access Key and its X username. Open X in the same browser and sign in to that same account.
2. Open the extension popup. Choose one of the four Modes. Only one mode should run at a time; do not install two active automation copies.
3. Open the mode panel using the round Fix logo. Press Profile Reload in its header. Check your own name and @username—not the profile you are visiting.
4. Premium means the Fix Access Key is active. It is not proof of an X paid subscription. Keep open keeps the panel visible; drag the logo/header and use the corner handles to resize.
5. For comments, select Use credit balance or Use API key in the extension popup, then Save Settings. One confirmed credit reply uses one balance. Your API provider may charge separately; there is no automatic credit fallback.
6. On a fresh install: Auto-Scroll gaps are 4, 5, 6, 7 seconds and Skip reposted posts is ON. Saved choices on an existing installation are preserved. Profile Engage delays are always at least 5 seconds, including old saved values.
7. Every Start/Run checks known expiry locally. When the last successful verification is 72 hours old, one shared server request is required. There is no six-hour/popup polling. A failed due check blocks a new run and retries no sooner than five minutes. Known expiry blocks immediately. Credits still require server authentication.

Do this in order

1. Paste post URLs in the input box. Named status links, i/status links and intent/like?tweet_id links are normalized.
2. Press Find Links. Check the removed duplicate/own/Memory counts; use View Links to inspect the filtered queue.
3. Set four Delay Between values, Pause After, and Like limit break (minutes).
4. Press Start. Live activity replaces the link input while running. Watch counts, current item, waiting time and runtime.
5. Press Stop before editing links. View Links → Find Links rebuilds the queue; Reset clears the current queue/progress/Failed archive, not saved Memory.

Find the right control

Control on the panel	What to do
Find Links / View Links	Find normalizes supported post URLs and filters duplicate post IDs, known own links and unexpired Memory for this mode. Anonymous IDs need an author check after opening.
Delay Between (sec)	Put four wait values in seconds, e.g. 6, 7, 8, 9. One is chosen between links. Page load and verification take additional time.
Pause After	For example: 10 links, for 5 min = after ten processed links, wait five minutes, then continue while the run is active.
Settings → Memory	Independent 48-hour Memory: view count, enable/disable, remove selected or confirm removing all. Find checks expiry. Removing Memory does not erase uncertain-submission guards.
Live counts / Failed Export	Liked = newly confirmed likes. Already liked = no click, saved Memory if ON, not Failed. Genuine failures have exportable URL/reason.
Like limit break (minutes)	Choose 1–1440 minutes; default 11. This is a configured wait, not proof X has cleared the restriction.

Limits, waits and safe restarting

> Visible Like-limit warning pauses immediately; without it, only verified OFF permits one retry. Two rollbacks pause. The pending link resumes after the configured wait. Stop clears this local Like wait; a new Start with the warning still visible pauses again before a click. Stop cannot clear X’s limit.

Stop does not undo an action already sent to X. On restart, existing Follow/Like states are checked before another click. A possibly sent reply is not blindly repeated: the duplicate-submit guard remains. No “Reviewed · skip” confirmation is required; a genuinely unconfirmed reply can still stay pending with an explanatory status.

Memory and saved progress

This mode’s 48-hour Memory is separate from the other post queue and from permanent Profile Memory. A saved Link post does not remove a Like link or vice versa. Memory is account-scoped and browser-local; uninstalling/clearing data can erase it. Failed attempts are remembered when Memory is ON. Already-liked results are not failed exports.

A small first run

Try a small owner-controlled run before a large queue. Check the actual result on X and the panel counts. These are local browser tools, not a promise of follower growth, unlimited comments, or protection from account restrictions. Do not automate unwanted or repetitive replies.

> Select language is the initial placeholder. Select English, বাংলা or हिन्दी before Open PDF / guide; without a selection no PDF opens.
